## Help!Not all plugins are interpreted by the module

Posted by donya1 - 2009/02/11 15:52

---

Hi! First of all - thanks a lot for the module! It saved me a lot of time :)

But there is one problem (not sure if it's a bug in any of the involved plugins/your module). Not all plugins are interpreted by the ariprocesscontent. For example:

1.the ariprocesscontent module is set to active

2.the custom php module which i use to test the plugins includes the following code (for googlemaps and tree different flickr photo stream pluins):

```
{mosmap width='200'|height='180'|lat='52.052312'|lon='4.447141'|
zoom='3'|zoomType='Large'|zoomNew='0'|mapType='Satellite'|showMapttype='1'|
overview='0'|text='sv DWO'|tooltip='DWO'|marker='1'|
align='center'}
{easyflickr count=2,size=t,tag=snow dog}
```

```
{flickr-album} Type=Search, Keywords=world domination {/flickr-album}
```

3. on the website only map and the easyflickr are embedded as expected, the last two plugins are schown just as a text.:angry:

Is this a problem in those plugins? Any idea how can i solve it?:(

Thanks you very much in advance!

Hello,

This plugins correctly work if you place this code in article content?

Regards,  
ARI Soft

Thanks for the very fast reply.

That was a really super question! I tried this in a content article and found out:

inside of the Jommla article every plugin (except {flickr-album} - it is a module) works fine. And (!) on the same page the ARI Process Conten module interprets all included plugins and even {flickr-album} also without any problems :woohoo: . But as soon as i switch to any other page (not content related (in url there is nothing like: ..index.php?option=com\_content..) the problem (i described at my first message) appears again.

Magic! :blink:

Since we are all busy and have to bring the things forward asap, i decided to use plugin which was working with ARI Process Conten module from the very beginning. But i am still wondering about the issue with all others plugins.

hello there,  
i happen to be working on this module  
exactly the same time as you posted

---

your issue. i was looking for similar answers, before i go dig the solution myself, but anyhow since you're the only soul with this problem ( + me ), here is somethings i found out which may help you..

two things...

1. the module must be publised on ALL pages ( unless you specifically do not want it's services on any page, it has to be all. ).

2. there is a possibility that some mambots do not use onPrepareContent, they may use the another event, onAfterDisplayContent, which is think is only in joomla 1.5.

in any case, \*if\* you are using joomla 1.5, to be safe try adding this in...

```
$dispatcher->trigger('onPrepareContent', array($row, $params, 0), true);  
$dispatcher->trigger('onAfterDisplayContent', array($row, $params, 0), true);
```

after the line  
\$dispatcher->trigger  
( 'onAfterDisplayContent'.....

this does the same thing the mod is designed for catering for those plugins which uses the other mentioned event.

if you're using joomla 1.0  
i have not got around to that working out a solution yet for that but it is likely similar, so you could probably figure it out.

to admin:

i am suffering a little bit as the width i get from this screen in the middle column is as you see me typing.

if at all it is possible for you to use a wider format to allow us oxygen, it would help.

bye and thanks.
