
Tablesorter - column width

Posted by Raymond R. Humphrys - 2009/07/11 23:28

Is the column width adjustable?

Hello,

Yes, you can use for this purpose CSS and 'widthFixed' parameter of 'ARI jTableSorter' plugin. For example, if you want that the first column have 100px width, you can use the following code:

```
{arijtablesorter widthFixed="false"}
```

```
column1  
column2  
column3
```

```
content1  
content2  
content3
```

```
content1  
content2  
content3
```

```
{/arijtablesorter}
```

Regards,
ARI Soft

Question: "style="width: 100px;" - where do find stuff like this? Are you referencing a property in a css for the plugin? I do not see my css.

I am still having a problem. I took your code and changed thw widths of all three columns in HTML mode and the cols are still equal:

```
=====
{arijtablesorter widthFixed="false"}
content2      content3      content1      column1      column1      column1      content1
content2      content3      content1      content2      content3
=====
=====
```
