problem with my custom component

_____

Hello!
I have just installed your plugin
ARI Smart Component Datatable pack, and am experiencing problems with
ARI JDataTable component.

I am trying to use it in my own component`s (my personal use only) formatted output.
But it seems that {arijdatatable} is just ignored.
Maybe the problem is, this component is suitable only for article output?
Then maybe there exists some sort of API command in your plugin, parsing the article and replacing this tags with the
necessary code, which i could use in my component before displaying the text.
I highly appreciate formatting functionality provided by this plugin and really want to use it in my component. Is there any
possible solution for this problem?

Re:problem with my custom component

_____

Hello,

By default ARI Smart Content comes with content plugin which works in article, but if you want to use it anywhere, you
can use System - ARI Smart Content Anywhere plugin for this purpose. Only instal it, enable and disable 'ARI Smart
Content' content plugin and it should help you.

Regards,
ARI Soft
