JTabview changes URI making back button cycle tabs

Posted by cplath - 2009/12/15 20:12

Hello,

When i click on tabs using JTabview, the URI is appended with something like: #jtabc_4b27e9f5002e9

This causes the page to scroll to the tab (which is not desired behavior) and also means that ,when using the back button, you have to cycle through each URI before getting to the previous page (also not desired).

I notice that this is not how it works on your demo site:
http://smart.ari-soft.com/ari-jtabview.html

Here is the page I'm having problem with:
http://bit.ly/66ywek

How can I fix this?

Thanks

Hello,

It happens because template.js file from your template contains the following code:

new SmoothScroll({ duration: 500, transition: Fx.Transitions.Expo.easeOut });

This code handles all link with # and provide effect which you see on your page when click by tabs. If you comment this code, all should work fine.

Regards,
ARI Soft
