
SQL Table Adding HTML to column data

Posted by ETFSmart - 2013/04/10 00:16

Is it possible to add some HTML code to one column of data read from a MySQL database before it is displayed? I can't figure out how to do this without putting the entire HTML string into the database.

I wish to turn a text string into a hyperlink. Any help would be appreciated.

Could you describe what data is stored in the column which you want to modify and how do you want it modify?

The idea is to take the column shown in the attached table and transform each entry to a hyperlink such as:

<http://www.etfsmart.com/etf/index.php?ticker=AADR>
<http://www.etfsmart.com/etf/index.php?ticker=AAIT>
etc.

The rest of the table should be displayed as it is shown.

So in other words adding some extra HTML to each entry in one column.

Thanks <http://www.ari-soft.com/images/fbfiles/images/Ticker.gif>

Use the following code:

```
{arisqltablecolumns}
  {arisqltablecolumn id="Ticker"}
    {coltemplate}{$Ticker}{/coltemplate}
  {/arisqltablecolumn}
{/arisqltablecolumns}
```
