## How to verify arisqltable settings

Posted by Mathias - 2013/06/04 20:57

---

Hi!  
I try to use arisqltable for the first time and get nothing.  
I have succeeded using csv, but when trying sql it is nothing when viewing.

Like this:

```
{arisqltable} {ariconnectionstring dbHost="localhost" dbUser="xxxxxxx" dbPass="xxx" dbName="xxxxx" dbType="mysql"} {arisqltablecolumns} {arisqltablecolumn id="MyID" alias="ID" className="idg"} {/arisqltablecolumns} {arisqltablequery} SELECT `MyID` FROM `xxx_MyID` {/arisqltablequery} {/arisqltable}
```

How can I verify that the attributes are set correctly?

Hello,

Download and upgrade the component then temporary set "Site -> Global Configuration -> Server -> Error Reporting" parameter to "Development" value on Joomla! configuration page.

After this page with "ARI JDataTable" should show PHP errors (warnings) if something works wrong.

Regards,  
ARI Soft

Hi!  
I did what you stated but still nothing. If I remove the ariconnectionstring section then an error appears, error 0.  
But as I need the settings in the connectionstring I have to add it again and then nothing...  
I have even removed the arisqltablecolumns to simplify it even more but still nothing.  
It is as if the Error reporting setting didn't work.  
Any more hints?  
I use joomla 3.

Hi again!  
When I changed from mysql to msqli it started to work.

Hello,

We suppose according to PHP configuration, it can't work with "mysql" driver, but it supports "mysqli".

Regards,
