JDialog- how to add a link in content to close it?
Posted by johntmcii - 2013/07/11 21:15

_____

How can I add a simple link in the JDialog content to close a JDialog that I've set to autoOpen on page load?

In other words, I would like for it to work just like the "X" link in the JDialog title bar that does nothing except close the dialog. The purpose is for JDialog to display an alert message on load and I would prefer the user click some link text I write versus an "X" on the title bar before proceeding.

_____

Hello,

Download and upgrade the component. After this add "id" parameter with unique value to {arijdialog} tag. It will look like:

{arijdialog width="350" height="200" title="Content" id="mydialog"}

And use the following HTML code to add a close button:

PS: Clean also browser's cache.

Regards,
ARI Soft
