
save last active page to cookie ARIJDATATABLE

Posted by mniederm - 2009/02/09 21:04

Hi, on my site the user can click on a row and then a php scripst does something, therefore the page will be reloaded, after reload the size of the table is set to the default size(length) and the user is on the first page. Is it possible to save the last active page and list size and maybe also from which row the user clicked, that the user comes back to the row where he clicked?

This would be great...

Best regards Michael:woohoo:

For example see page:

<http://www.aktionsfinder.at/aktionsfinder/alle-aktionen.html>

with user test test

Hello,

We select second tab, click 'gemerkt' and page reload, and after this second tab shows. It seems as correct. Can you describe more details that do you mean? Also can you say about problem with jquery.cookie.min.js file, it seems that you hosting provider resolve this issue, can you write about some words in corresponding topic?

Regards,

ARI Soft

Hi, now I do not talk about the TAB I talk about the TABLE.

The user can define the size of the table and when there are more then one page he can also click on 'merken' on the second site of the table. When the user has set the table length to 50 and he clicks on merken on the second table site, the page reloads. After reload the table should have the size 50 and the user should be on the second page. The best would be if he also would be on the row where he clicked. But this is something I do now by my own with a javascript, but i can only jump to an anchor on the first page, because after reload I always come to the first page with the default size. Do you know what I mean?

It would be also great if the user has after reload the same sorting he had beforehand and if he entered a filtertext (or searchtext) if this text would be set after reload.

Hello,

We think about adding this feature in one of the following releases.

Hello,

Download the latest version of ARI Smart Content in 'Member Area'. It contains updated ARI JDataTable plugin. It have two new parameters: bStateSave and iCookieDuration. You can use it for saving table state.
