
How to get the target set to top frame or parent?

Posted by ozziemate - 2010/05/12 10:52

Hi,

I am caught in a bit of dilemma and need to use an iframe to display the menu. The main site menu works fine but I need to get set the target frame to parent or top for the inserted frame/menu in another site.

This is so that when a person clicks on the menu link on the foreign site the page opens the main site

Is this easy to configure or is it even feasible? and how would I do it if it is?

Thanks in advance...

Scott

site: <http://confest.bizzymate.com>

click on the forum link in the menu

Hello,

Sorry, but we can't open your link. Could you check it? It's available for all external users?

Strange the link posted above works fine for me... possibly a transient server issue?

The site is online and open to public view although only an obscure development subdomain.

Possibly the answer to my problem can be found in the Joomla software more so than with your extension. To be able to set menu link frame targets using the standard article creation /menu system.

You can modify `/modules/mod_ariyuimenu/mod_ariyuimenu/templates/menu.html.php` file. Find line #83 and change the following code:

```
$aAttr = array('class' => $hrefCssClass . ($isDisabled ? ' ' . $hrefDisabledCssClass : '') . ($isSelected ? ' ' . $hrefSelectedCssClass : ''));
```

to the following code:

```
$aAttr = array('target' => '_top', 'class' => $hrefCssClass . ($isDisabled ? ' ' . $hrefDisabledCssClass : '') . ($isSelected ? ' ' . $hrefSelectedCssClass : ''));
```

It should help.
