
getting started with ARI YUI Joomla Module

Posted by tedmyers - 2010/05/26 18:28

I downloaded the ARI YUI module today. I installed it using the Joomla 1.5 Installer.

Now what do I do? Is there any documentation that tells how to create the menus?

thanks,

Ted

Hello,

It works as many other Joomla! menu modules. Create menu items with help standard Joomla! menu manager. For this open 'Menus->Menu Manager' page on Joomla! backend. Then choose necessary menu in module settings and configure other module parameters. That's all.

Do I also need to create the CSS for the menu?

The module loads all necessary CSS and javascript files automatically. If you have any difficulties, you can describe it and we'll help you.

PS: You can provide temporary access to your Joomla! backend by email and we'll help you configure module.

Thanks for your response. It's coming along but I still have some problems. Since this is a new site, it hasn't been published to the net yet. I hope to do that this week. I'll be back in touch with you when it is available for outside access.
