
External Link Problem

Posted by shanewhite - 2010/04/09 14:12

First of all let me say the ARI Ext Menu works great!

I am having an issue though. I am new to Joomla, so this may be a dumb question. When I create a submenu item that is an external link (ie. <http://www.google.com>), everything appears to be correct. However, when I look at the submenu item in production, it looks like this <http://www.google.com/?Itemid=76>. It adds an itemid number to end of the url. Any advice?

Thanks a lot for any help or information!

Shane

Hello,

Could you provide temporary access to your Joomla! backend by email and say link to page where we can see this issue that we can investigate it and provide solution?

Regards,
ARI Soft

The issue is with the home button...which I have set to <http://www.google.com> for testing purposes. Also another link is a submenu item under contractors...alabama one call link.

Why does it append an itemid after the link url?

You guys rock!!! You responded very quickly and had my issue fixed in no time. The fix was to update the menu module.
Thanks a lot!

:) :) :)
