## horizontal menu problems/questions

Posted by Ashlie - 2010/08/26 18:08

---

I just installed ARI Ext Menu, and I really like it, but I'm having a couple of problems that I hope you can pinpoint. I apologize if these have been addressed already in the forum. I looked through already and couldn't find the answers.

Here's the website: <http://www3.jruuc.org/>

I'm using FF 3.6.8, if that matters.

I set the menu to User3 module because that was the only way I could get it to line up properly.

1. The down arrow is covering the menu item text.
2. Sometimes after moving mouse off of the parent menu, the submenus remain (artifacts?), but in smaller boxes.
3. Can I make a fixed width for both the menu items and the submenus? I'd like the menu to take up the entire length.

Thanks for your time!

Actually I think I figured out problem #2, I had "Show only active sub-menus" toggled to no. I switched it to yes and that seemed to fix that... but now the submenu flashes once before becoming solid.

Hello,

This problems occur due to site template styles. Open index.php file of site template, find the following code:

and use the next instead of it:

And set 'Auto width' property in module settings to 'Yes'.

Same issues. Can't find to change.

Also, the drop downs aren't showing up at all. Suggestions?
