
Ipadi Portrait view non-responsive

Posted by upstagegirl - 2016/01/20 21:05

I am using Ari Image Slider (latest version) and have configured it to be responsive. Slider displays properly in all views except Ipad portrait view where the slider images are not resizing and are too big. Please take a look and advise what changes I need. URL www.americanglass1.com

Hello,

Could you send a screenshot and specify what Safari version is used on your iPad?

Regards,
ARI Soft

Here's the screen grab in portrait view.
safari 601.1

According to your screenshot It is not clear what's wrong, width of the slider is less than width of browser window.

The slider image is not sizing down so that makes the content on the right side of the slider is wrapping down below it. In landscape view on computer or Ipad the two sit nicely side by side. When the Ipad is in portrait view the slider images are still at the original size forcing the content down below it.

This problem with site template styles and selected module position. The slider occupies available space and it depends on styles of container element.
