
Page scrolls when Lightbox opens

Posted by eraz - 2012/03/26 18:26

I'm using ARI Lightbox for showing inline content on this site:

<http://www.spotcatch.net/ueber-mich.html>

(Last link in the article, named: "Was sind das fñŒEr Links?")

Unfortunately, when clicking on this link, the browser automatically scrolls up to the top, and then lightbox opens at the bottom. I don't want this, i want it to be centered in the middle of the screen when clicking on it (without browser scrolling!). I've tried to set the option "Allow Resize" to "Yes" like suggested in another thread. But when i do so, lightbox does not even show up...?

Hello,

We suppose this problem with smoothscrolling plugin which is used on your site.

Regards,
ARI Soft

Hmm, what a pity. Unofortunately i can't migrate to another scroller at the moment. Is there another way to show content like that in your lightbox?

/edit

By the way, i have seen that there is a new version available, could you please tell me where i can find a changelog?

We can recommend to contact author of the plugin and ask how to disable scrolling for specific elements. It seems the plugins attaches to all "A" elements on a page.
