
JoomFish Compatibility

Posted by WINEMAN - 2010/09/05 07:51

The Joomla Extensions Directory lists this extension as supporting multilingual functionality. How does one go about translating image titles and descriptions using this extension and JoomFish?

Just purchased the extension and can't seem to find any documentation on this. :(

'Language' flag on JED means that the module and the plugins support Joomla! internalization approach which helps to use different languages for module and plugins parameters pages. About your requirement, we have updated the module and now it provides ability to use different CSV files with descriptions for different languages. For this create CSV files with file name in the following format: ..csv where is base file name without extension which is indicated in 'Description file' parameter, is tag of active site language. For example, if active language is 'Russian' and value of 'Description file' parameter is 'arifancybox.csv' create file with name arifancybox.ru-RU.csv. Updated extension can be download in 'Member Area', after this upgrade 'ARI Fancybox' module that enable new feature.

Regards,
ARI Soft

Thank you again for the quick reply.
Getting back to my TUTORIALS topic, there was no sample of what information to include in the .csv file. :unsure:

Is there a sample somewhere in this forum?

Open the module settings page and see 'Description' field. It contains instructions how to use the module and contains link to sample CSV file. See screenshot for more details please:

<http://www.ari-soft.com/images/fbfiles/images/fancybox.png>

PS: You can also find sample CSV file in attach to this post. It contains descriptions for images with file name image_01.jpg and image_02.jpg
