
Accessing the DOM within Sexy Lightbox Lite

Posted by aschueckler - 2011/06/29 13:31

Hi there,

First I would like to say I absolutely love your plugin, and have used it many different times. It is one of my favorites. That being said, I have been working for hours on trying to get this without help to no avail. Basically, I am calling SexyLightbox and within the lightbox I have a series of divs. Using a link within the lightbox, I am trying to call a javascript function that hides and reveals each div.

Normally I would write something like:

```
document.getElementById('objectName').style.visibility="hidden";
```

This is not working because (and I may be wrong in this) but SexyLightbox works on a layer above the base document layer. How do I need to change the above command to make it reference an ID found within the lightbox content?

Thanks for your help.

Hello,

Where we can see sample of usage? Do you load remote page into the lightbox?

Basically the idea of the lightbox is to be a "logbook" that the user can browse. All of the data for the pages is loaded when the index page is loaded. Each page is a separate div, all hidden. When the lightbox is activated you have two pages that are visible. Clicking a link (the lower right hand dogear) should then hide the div, and unhide the next one.

<http://www.skybourne.com/build/>

Open the lightbox by clicking the book in the left corner under the twitter feed.

UPDATE:

It seems that it is hiding and un hiding the content correctly, but not while the lightbox is up. Once the lightbox is closed, upon reopening, the correct content is shown.

To answer your earlier question, the javascript is on the same webpage that calls the lightbox itself, though it is a separate page, its called within joomla as a module. It uses the inline version of the lightbox. The javascript is outside of the lightbox's content div.

You can place necessary code for "logbook" into an article and load this article into the lightbox instead of loading "logbook" as inline content.

I cannot get the article to pull into the lightbox, I am using the following code in a module to open it:
Show article

It is in the same place, <http://www.skybourne.com/build/> , instead of the book click on the link that says "show article".

It seems this problem with your site template or a 3rd party extension. You can try to open the next link into a browser:

http://www.skybourne.com/build/index.php?option=com_content&view=article&id=17

and it works, but the following link doesn't work:

http://www.skybourne.com/build/index.php?option=com_content&view=article&id=17&tmpl=component&tmpl=component

These links are not related to "ARI Sexy Lightbox Lite" extension, but it seems a PHP error occurs on the second page due to your site template incorrectly support print mode. Check web server error log, we suppose it contains error(s) when help to find the reason of the problem.
