## Problem with iPad - jittery lightbox

Posted by tlawson - 2012/02/17 19:11

---

I'm using the flickr source and have got everything running great, except on iPad.

When I select a photo on iPad, the lightbox comes up just out of view at the top of the screen. It then starts hunting, trying to display on the screen. So, it starts stair-stepping down the screen until I can see the photo, but it's still jumping.

My site is using a special plugin called Mobile Joomla and I'm wondering if that is conflicting in some way. It creates a different template when it senses that the device being used is an iPad/iPhone/iPod. Everything works great on my Android devices, just the Apple ones are screwed up. PC/Mac computers are also fine.

To see what's happening, go to <http://www.mobilityinitiative-test.com/index.php/gallery>

I love the component... If I could just get it to work, I'd be ecstatic.

Help!!!

Hello,

Unfortunately we can't check it on native iPhone/iPad device. It works fine in "Electric Mobile Simulator".

Regards,  
ARI Soft
