
Column Filter for Ari Data Tables

Posted by she - 2015/12/23 10:17

Hey Guys,

I have installed the custom Column Filter:

<https://code.google.com/p/jquery-datatables-column-filter/>

It's a bit old but still working, tested with an normal jquery table js.

Already enabled it and anything inside ari.

I just dont know how to execute the contructor method(normally `$("table").dataTable().columnFilter();`)

But since I am using ari, there is no `.dataTable()` available. (So I just need to know the method to call and I am happy)

Hope you guys can help me.

Website is:

<http://www.timberplus.com/en/news-en/version-history-en.html>

Thx for any help :)

Hello,

Set "Load jQuery method" parameter to "Local copy" value in module settings.

I guess you mean Load Method: on Load right?

Set that but still getting an error, could you check that on the site provided?

Otherwise I can provide a backend access too.

Appreciate any help!

We mean "Load jQuery method" parameter. If you use "ARI Data Tables" v. 1.15+, this parameter is located on "Advanced" tab on module settings page:

<http://www.ari-soft.com/images/fbfiles/images/dt-5751e4ffd94cf513693d57b4cbe71c20.jpg>

For previous versions it is located on main module settings tab.

Oh, yeah did not saw that one :/

Ok but I still got the same error.

Uncaught TypeError: \$(...).addClass(...).dataTable(...).columnFilter is not a function

An incorrect version of
/modules/mod_aridatatables/includes/js/widgets/datatable/plugins/columnfilter/jquery.dataTables.columnFilter.js file is
used on your site. Download original version [here](#) and use it.
