
Data tables from J1.5-J3x HTML source for data?

Posted by maestro - 2016/04/21 01:29

We have several tables done in an old Joomla 1.5 site and we have purchased the ARI data tables update to the latest version. How can I make the tables in the new system work like they did in the old? In the old one we used Plain HTML Table as the data source but it appears that option is not available in the new version? Is there any easy way to migrate from the old to the new without having to recreate everything?

Hello,

We have "System - ARI Data Tables" plugin which supports ability to use the extension in the following way:

```
{aridatatables type="inline" moduleId="MODULE_ID"}  
... HTML table goes here ...  
{/aridatatables}
```

We can send the plugin by email.

Regards,
ARI Soft

That would be great. Please send it to the email associated with this forum account. Do I need to uninstall the current data tables plugin and then replace it with the one you will send?
