
Fill variable before creating table in sql query

Posted by Ron van Laarhoven - 2016/11/02 08:12

At the moment I'm filling variables like `$user = JFactory::getUser()` in the format part, for each row in the table, I need this to check and create an editlink for classified users in each row.

It looks like this is time consuming, is there a way to declare vars before the creation of the table, this way I have to fill those variables only one time.

I

Sorry, found the solution by creating the variable inside the article where the table is displayed.

Next time it's better to think before posting a question ;)
