Scroll images

Posted by Zappertje - 2012/04/15 15:05
_____

I just bought the ARI Scroller module. First of all I must say that the documentation is in one word abysmal!

Many of us are not exactly full fledged PHP experts:-)....

All I want is about 10 images to rotate vertically in a module on my joomla site. And how to link the images to a url...

However I can not find any documentation on how to use the module with images...

Could anyone please tell me how to display images on this module and link them to another page?

Thanx!

Stephan

_____

Hello,

The extension scrolls a HTML content, it can be a simple text or text with image(s). Just place necessary content in "Content" parameter in module settings. If you want to show several images into the scroller, place the next HTML code in "Content" parameter:

...

Where LINK_TO_IMAGE1 is a link to an image.

If you want to create hyperlinks for images, use the next code:

Thanx for the reply. It's still not very simple, using the editor in joomla would be al whole lot easier...

If I want to link the image to a lager version of itself in a modal box, what would be the code for that?

Regards,

Stephan

Re:Scroll images

_____

If you want to use the scroller in an article, you can use "System - ARI Scroller" plugin and use a WYSIWYG editor to edit scroller content.

What lightbox extension do you want to use?

Re:Scroll images

_____

Hi,

Thanx for the quick reply!

I want to create a module with about 10 images that slowly go round vertically, and I want to link the images to a larger version in a modal box.

I have the Modalizer plugin installed. I can link the images now, but only to a new page with the image.

Regards,

Stephan

Re:Scroll images

_____

Thanx,

One final question...

It works ok, it displays the images and all, but it stops:-)...

Is there a way to make the images loop? So that if you stay on the site, it starts all over again?

Grtz!

_____

Sorry for the late reply, but we've enjoyed a nice vacation:-)....

The site is located at www.dipx.nl/index.php .

The images are displayed and the modal box works as well, but the images should loop, instead of stop after going round once.

Grtz.

_____

Images appears after a few seconds after going round once and it seems this problem with "Height" parameter in module settings. Your site template show part of the page adopt it to screen resolution and cut off part of the scroller. Try to change "Height" parameter for example to "400" and check the scroller.
