
ARISQLTABLE Problem: \"select *\" and \"select field\"

Posted by gramar82 - 2011/02/10 08:48

Hi,

i have a problem with different select statments. Everything works fine when i run a statement with "select *" or a select with only one column. When i try to run a select with minimum 2 fields i get a white page as result.

I have this problem only with created tables of myself. With standard joomla tables(jos_xx) everything works fine.

What do i wrong?

Hello,

Could you provide code which you use and if possible temporary access to your Joomla! backend by email that we can investigate this issue?

Regards,
ARI Soft

Sorry, at the moment i have the project only on my localhost.

Here is the used code:

This works:

```
{arisqltable}
{ariconnectionstring dbHost="localhost" dbName="test" dbUser="root"
dbPass="" dbType="mysqli" persistent="false"}
```

```
    {arisqltablequery}
SELECT id AS ID,name AS NAME
FROM jos_users
    {/arisqltablequery}
{/arisqltable}
```

This works:

```
{arisqltable}
{ariconnectionstring dbHost="localhost" dbName="test" dbUser="root"
dbPass="" dbType="mysqli" persistent="false"}
```

```
    {arisqltablequery}
SELECT genre
FROM dvds
    {/arisqltablequery}
{/arisqltable}
```

This don't work:

```
{arisqltable}
{ariconnectionstring dbHost="localhost" dbName="test" dbUser="root"
dbPass="" dbType="mysqli" persistent="false"}
```

```
    {arisqltablequery}
SELECT genre,datum
FROM dvds
```

{/arisqltablequery}
{/arisqltable}

Does this SQL query work fine in a SQL manager application like PHPMyAdmin? BTW, if you run SQL query on Joomla! database, you can omit {ariconnectionstring} tag.

Thanks for the tio to omit the tag.

Yes, the query work fine in PHPMyAdmin. Also from an external SQL Manager.

I followed your instructions but i don't get an error. Where the error message should be? In the browser?

To be a little bit more detailed: I get a totally empty white page in the browser. Also the rest of the joomla page don't appears.

If you get blank page, it can be problem with PHP configuration. Try to install PHP Settings plugin that increase 'memory_limit' PHP parameter. You can also try to add "LIMIT" statement to your query that check works it or not. Code will look like:

```
{arisqltable}  
  {arisqltablequery}  
SELECT genre,datum  
FROM dvds LIMIT 0,5  
  {/arisqltablequery}  
{/arisqltable}
```

Query with "LIMIT" works. I will try later also PHP settings.

Thanks for your help.

It seems this problem with "memory_limit" PHP parameter, we suppose table contains a lot of records and memory limit is exhausted when the plugin try to load all data.
