CSS with arisqltable

Posted by cplath - 2009/04/05 00:04
_____

I just installed the Smart Content Component.

I've successfully created a sqltable, but I'm unable to have it formatted at all.

This is my sqltable code:

{arisqltable}
    {ariconnectionstring dbHost="" dbUser="" dbPass="" dbName="" dbType="mysql"}
    {arisqltablecolumns}
      {arisqltablecolumn id="RESORT" alias="Resort" className="snowtableentry1"}
      {arisqltablecolumn id="NEW24" alias="24hr" className="snowtableentry1"}
    {/arisqltablecolumns}
    {arisqltablequery}

    {/arisqltablequery}
{/arisqltable}

And the resulting HTML:

ResortNameNew24Arapahoe Basin10...

As you can see, there are no classes on the rows or data.   What am i missing?

Thanks

Nevermind...   My id's didn't match my database column names.

I've moved on to wrapping the sqltable in a sorted table now.   I found the css for the sort table buried in the js folder for the plugin.   So i'm editing style.css in the blue theme directory to change the style.   I'd have to think there's a better way to do this, like creating my own template at least.

Where is the active template set for Jtablesorter? Can i create my own? And better yet, can I just add a section to my main CSS file and use it?

Thanks

Hello,

You can use 'CSS Templates' for creating your own CSS template. Active CSS Template will be automatic loaded on frontend. And editing CSS in plugin folder isn't better solution because after upgrading or re-installing the component this change will be lost, use 'CSS Templates' that override needed CSS rules.

PS: You can omit {ariconnectionstring} if you are used Joomla database.

Regards,
ARI Soft

Hi, thanks for the quick response.

I also found a post referencing ThemeRoller on the jquery site. This looks like it could help with what I'm trying. I created a theme, but how do i use it now?

I uploaded it to: /plugins/content/arismartcontent/system/ari_jquery_ui_loader49d7df5b27d95/js/1.5.2/themes/
but am not able to select it from the jquery ui plugin configuration screen.

sorry, one more question too...

Is it possible to configure it so that headers aren't created for the title of tabs and accordion items?

_____

You can't change tab layout, if you have any problem with H3 style you can override it with help 'CSS Templates'. About ARI JQuery UI Loader and ThemeRoller, currently you can't create new theme, but you can submit feature request and we'll implement it in one of future releases.
