
Using Javascript with in ARI Smart Content

Posted by CSSDAweb - 2014/02/05 15:04

I've discovered that I can include HTML within a ARI Smart Content, but I've not been successful using jQuery/javascript. Can jQuery/javascript be used within ARI Smart Content? If so, would you please provide an example.

Hello,

Could you provide a sample where we can see what javascript code do you want to use?

Regards,
ARI Soft

I discovered that by putting a `<tag>` inside of your `{coltemplate}` tag, most, perhaps all JavaScript can be used. Here's what I'm now using to display a club listing at, <http://coloradosquaredance.com/index.php/necsdcl-clubs>

```
{arijdatatable bPaginate="true" sPaginationType="full_numbers" iDisplayLength="25" bAutoWidth="false"}
{aricsvtable file="/data/xml/areaClubs_NE.csv" sortBy="dayWeek" sortDir="asc"}
{aricsvtablecolumns}
{aricsvtablecolumn id="dayWeek" alias="Day" pos="1" width="10%"}
    {coltemplate}
    var day = '{$dayWeek}'.substr(2,3); document.write(day);
    {/coltemplate}
{/aricsvtablecolumn}
{aricsvtablecolumn id="clubIcon" alias="Icon" pos="2" width="25%"}
    {coltemplate}{/coltemplate}
{/aricsvtablecolumn}
{aricsvtablecolumn id="clubName" alias="Name/Description" pos="3"}
    {coltemplate}{$clubName} - {$danceLevel} - {$clubDesc}
    - View Club Events Calendar
    - {arilinkifier target="_blank"}Web Link: {$webLink} {/arilinkifier}
{/coltemplate}
{/aricsvtablecolumn}

{aricsvtablecolumn id="clubContactInfo" alias="Contact Info" pos="3"}
{coltemplate}{arilinkifier target="_blank"}{$clubContactInfo} - {$clubContactEmail}{/arilinkifier}{/coltemplate}
{/aricsvtablecolumn}

{aricsvtablecolumn id="venueName" alias="Venue" pos="4" width="25%"}
    {coltemplate}{$venueName}, {$venueAddress1}, {$venueCity}, {$venueState} {$venueZipcode}
    {/coltemplate}
{/aricsvtablecolumn}
```

```
{aricsvtablecolumn id="cssdaMember" alias="CSSDA" pos="5" width="12%"}
  {coltemplate}{$Area} / {$cssdaMember}{/coltemplate}
{/aricsvtablecolumn}

{/aricsvtablecolumns}
{/aricsvtable}
{/arijdatatable}
```

Values in "Day" column are shown as defined in javascript:

Yes, the value in column {\$dayWeek} includes a number, (i.e., 1 Sun) so that the column can be sorted by the day of the week, but I don't want the number to be shown so I use JavaScript (var day = '{\$dayWeek}'.substr(2,3); document.write(day);) to strip away the number and display just the day of the week. Is there a better way to accomplish the same task?

A possible solution is adding a custom filter to
\administrator\components\com_arismartcontent\kernel\SimpleTemplate\Filters\ folder and use it to format value of "Day" column on server side without javascript.
