CSS overrides

Posted by nickc4555 - 2014/08/20 06:19

_____

Is there a recommended way of overriding css in JDataTable? So far I have modified the core css files (lightness.all.css and datatable_jui.css). That works, but will get overwritten when you release an upgrade.

I can't use my template's custom.css because yours loads after it.

I see there is a CSS Templates section in the admin options, but I can't work out how it's used.

_____

Hello,

You can create a CSS template in "CSS Templates" section on component backend (don't forget to enable it) and place custom CSS rules in the created CSS template.

I must have forgotten to enable it the last time I tried that method. Thanks very much, this is a great component, but some comprehensive documentation would be really useful!

_____

Good news. Will there be an upgrade from the one I just purchased?

_____

New version will be available for all "ARI Smart Content" subscribers, but it will not be compatible with old versions because it will contains new or enhanced widgets and use new main principles.

Regards,
ARI Soft
