
SQL Query

Posted by Marsm - 2014/11/08 18:08

Hi,

I use the following SQL query for Ari Data Tables:

```
SELECT Composer, Title, Category, Information FROM leergangpiano WHERE Level=1
```

How do I 'translate' this query for the Ari Data Table module in Ari Smart Content?

Thanks,
Marsm

Hello,

Do you mean "ARI Smart Content - DataTable" module from "ARI Smart Content" v. 2.x?

Open module settings page, find "Data source" parameter and click by "Select" button to select an existing data source (it can be an SQL query or CSV file) or create a new one. See also this video tutorial.

I already watched the video.

I created a new SQL query with parameters: DB connection to Joomla database and I use following query: `SELECT Composer, Title, Category, Information FROM leergangpiano WHERE Level=1`. But it isn't working at all (blank page on frontend).

I read in the manual that a SQL query looks something like `SELECT id, title FROM #__content WHERE ({ $REQUEST:search|empty: } = " OR title LIKE CONCAT('%', { $REQUEST:search|empty: }, '%'))`.

My question is, is my query ok?

Thanks.

The query looks fine. A blank page appers if a PHP error occurs. Check web server error log or set temporary "System -> Global Configuration -> Server -> Error Reporting" parameter to "Development" value in Joomla! settings and send info what PHP error occurs.
