

Using Javascript inside of Columns settings ver 2.

Posted by CSSDAweb - 2014/12/14 19:59

With the previous version of ARI Smart Content, I was able to use JavaScript by enclosing it inside of `<code>` tags, but when I try to do that with ver 2.x, I get code showing up at the top of the page, and can't continue unless I delete the .csv file and start over. What is the syntax for using JavaScript inside of the Columns Setting Format? I need it to avoid having line breaks when the specified column is null.

Hello,

Upgrade the extension to v. 2.2.3. It should help.

Regards,
ARI Soft

Thank you. I've upgraded to v 2.2.3, and I no longer get an error when I include a `<code>` tag in the column setting, but I'm still not getting javascript to work. In ver 1.x, I can use the following, `var role = '{$role}'.substr(3); document.write(role);alert(role);`. In ver 2.x this doesn't work. What is the proper syntax to use Javascript with ver 2.x?

Use `{ $value }` or `{ $columns:value }` variable instead of `{ $role }`
