
Possible Bug: Javascript / Responsive Enabled, v2x

Posted by CSSDAweb - 2014/12/15 17:49

I have the following code working nicely in a Columns Settings > format option for a data table, but when I enable Responsive in the module, it never completes. The page with the table starts to load, but hangs waiting for a socket/localhost. This only happens when Responsive is enable. It happens using Chrome, Firefox and IE.

```
{ $value }
```

```
if ('{$columns:address}') { document.write('{$columns:address}') };
if ('{$columns:city}') { document.write('{$columns:city}, ' ) };
if ('{$columns:state}') { document.write('{$columns:state} ' ) };
if ('{$columns:zipcode}') { document.write('{$columns:zipcode} ' ) };
if ('{$columns:contactPhone}') { document.write('{$columns:contactPhone} ' ) };
if ('{$columns:contactEmail}') { document.write('{$columns:contactEmail} ' ) };
if ('{$columns:webLink}') { document.write('{$columns:webLink} ' ) }
```

Hello,

Use the following code in "Columns settings -> Format" value:

```
{ $columns:address|format:%s }
{ $columns:city|format:%s }
{ $columns:state|format:%s }
...
```

So, am I interpreting this response correctly? If 'Responsive' is enabled, you have to add |format:%\$ to every field displayed or for every field where there is a column format added.

It is not a good approach to do it via javascript and use "document.write" construction. We provided the solution how to do it on server side.

So, is it correct to say that 'format:%s' does the same thing as document.write? If so, how am I suppose to know that? There is nothing that I've found in the documentation (http://www.ari-soft.com/docs/arismartcontent/v2/html/ARI_Smart_Content_UserGuide.html?Datatable.html or http://www.ari-soft.com/docs/arismartcontent/v2/html/ARI_Smart_Content_UserGuide.html?SQLqueries.html#table_formatters) with regards to using ' | ' or the 'format:%s'. What other server side options are available, but not documented?

It is formatted values on server side. "format" calls "sprintf" PHP function with value of the current cell.

The documentation has not contained description of formatters yet. We will update it soon.

Okay. Thank you, but not having documentation for how to do things that can be done in v 1.x in 2.x is sure making it difficult for me to migrate from v 1.x to v 2.x.
