
arilinkifier in v 2.x

Posted by CSSDAweb - 2014/12/16 04:43

What the best way in v2.x to implement the arilinkifier function that was in v1.x?

=====

Hello,

Could you specify in what context you used it before?

Regards,
ARI Soft

I used it to produce links for email and web addresses embedded with other text pulled from a .csv file thus avoiding the need to have them in a separate field. Here's the code from a v 1.x table where I'm using it.

```
{arijdatatable bPaginate="true" sPaginationType="full_numbers" iDisplayLength="25" bAutoWidth="false"}
{aricsvtable file="/data/xml/allAreaClubs.csv" sortBy="dayWeek" sortDir="asc"}
{aricsvtablecolumns}
{aricsvtablecolumn id="dayWeek" alias="Day" pos="1" width="5%"}
{coltemplate}
var day = '{$dayWeek}'.substr(2,3); document.write(day);
{/coltemplate}
{/aricsvtablecolumn}
{aricsvtablecolumn id="clubIcon" alias="Icon" pos="2" width="10%"}
{coltemplate}{/coltemplate}
{/aricsvtablecolumn}
{aricsvtablecolumn id="clubName" alias="Name/Description" pos="3" width="30%"}
{coltemplate}{$clubName} - {$danceLevel} - {$clubDesc}
- View Club Events Calendar
- {arilinkifier target="_blank"}Web Link: {$webLink} {/arilinkifier}
{/coltemplate}
{/aricsvtablecolumn}

{aricsvtablecolumn id="clubContactInfo" alias="Contact Info" pos="4"}
{coltemplate}{arilinkifier target="_blank"}{$clubContactInfo} - {$clubContactEmail}{/arilinkifier}{/coltemplate}
{/aricsvtablecolumn}

{aricsvtablecolumn id="venueName" alias="Venue" pos="5"}
{coltemplate}{$venueName}, {$venueAddress1}, {$venueCity}, {$venueState} {$venueZipcode}
{/coltemplate}
{/aricsvtablecolumn}

{aricsvtablecolumn id="cssdaMember" alias="CSSDA" pos="6" width="10%"}
```

{coltemplate}{\$Area} / {\$cssdaMember}{/coltemplate}
{/aricsvtablecolumn}

{/aricsvtablecolumns}
{/aricsvtable}
{/arijdatatable}

Currently the extension doesn't support this plugin. It is possible to format data using "Columns settings -> Format" parameter.
