CSV files and Gchart

Posted by stephanbeek - 2015/02/16 14:03

_____

Gchart with data from csv files works, but I have some difficulties.

When I use this data for fruit harvest per year / fruittype (delimiter set to ;):
;2012;2013;2014
Apple;100;110;90
Pear;90;80;90
Cherry;60;70;50

Then no chart is shown.
If I edit the data to:
;y2012;y2013;y2014
Apple;100;110;90
Pear;90;80;90
Cherry;60;70;50
The the chart is shown ok with the y2012, y2013 and y2014 labels on the x-axis.

So I have to place some non-digit char before the year numbers. I tried working with " as an enclosure char, but this does not work at all. How can I get numbers as x-axis labels?

Regards,
Stephan

_____

Hello,

Send screenshots of data source settings page and module settings page by email please.

Regards,
ARI Soft

_____

Download and a upgrade the extension to the latest version (2.2.12) including "GChart" application.

Regards,
ARI Soft

_____

Thanks, this works now.

Bit off topic: is it possible to make a csv file that will render the graph uploaded here in the attachment?

The question is:
(1) How do I get the labels on the left of the graph before each bar;
(2) How do I get different colors for each bar.

If I use this:
;number

Apple;17
Pear;10
Plume;1
then I get different colors, but only one centered label "number".

If I use this:
;Apple;Pear;Plume
number;17;10;1
then I get labeled bars, but all in one color. http://www.ari-soft.com/images/fbfiles/images/demochart.jpg

_____

"GChart" can't show data in this way.
