
More then one theme on a webpage

Posted by stephanbeek - 2015/04/23 13:05

See image attached.

I use an Arisoft accordion to make a menusystem on the mobile representation of a website (with a twitter bootstrap). For this I use a UI made with Themeroller: "cwmobilemenu". This accordion is placed in a module and the theme is included with the statement: theme="cwmobilemenu".

On the website I use Arisoft tabs and Arisoft accordions on several pages. Here I use another theme, called "cleywech" also made with Themeroller. This is set as the default jQuery UI theme in het configuration of the plugin settings.

When I go to a webpage that has an Arisoft tab or accordion with the default theme, then the theme of the menu accordion system also changes into this default theme. I tried hardcoding each call of an tab or accordion with the theme="cleywech" parameter and tried setting the default theme to "cwmobilemenu". No effect. All the time the "cleywech" theme in the content of the page overrules the "cwmobilemenu" theme in the top module.

It is essential that I can use more then one theme on a webpage / that I can use a different theme in the topmodule. How to do this?

Regards

Hello,

For example the following code works fine and create accordions with two different themes:

```
{accordion theme="blacktie"}
  {item title="Item 1"}
    This is the first item
  {/item}
  {item title="Item 2"}
    This is the second item
  {/item}
  {item title="Item 3"}
    This is the third item
  {/item}
{/accordion}
{accordion theme="blitzer"}
  {item title="Item 1"}
    This is the first item
  {/item}
  {item title="Item 2"}
    This is the second item
  {/item}
  {item title="Item 3"}
    This is the third item
  {/item}
{/accordion}
```

Could you provide a link to a page where the problem occurs?

Regards,
ARI Soft

Re:More then one theme on a webpage

I now know how to get multiple extra themes working together on one webpage.

The instructions in the Arisoft helpfiles read:

" Add a new jQuery UI theme

(...) If you want to add a new theme, create it using jQuery UI ThemeRoller and download it. After this open the downloaded archive, find jquery-ui.min.css file and rename it to style.css then open \media\arismartcontent\jqueryui\themes\ folder on your server (you can open it by FTP or use Joomla! file manager extension like eXtplorer), create a folder for your new theme and copy style.css file and images folder from the downloaded archive to the created folder on your server.

Some important things, for example you want to create a new theme with name mytheme then set "CSS Scope" parameter to .jui-mytheme value on ThemeRoller download page: (...)

Create the folder with name mytheme in \media\arismartcontent\jqueryui\themes\ folder and copy style.css file and images folder to the created folder. After this the new theme with name mytheme will be available in settings of the applications which support jQuery UI themes. "

But ... When I make a new jQuery UI theme with ThemeRoller and I set the CSS Scope to ".jui-cwmobile", then the file "jquery-ui.min.css" does NOT have the necessary prefix ".jui-cwmobile" before each class definition.

The css file reads:

```
.ui-helper-hidden {
  display: none;
}
.ui-helper-hidden-accessible {
  border: 0;
  clip: rect(0 0 0 0);
  height: 1px;
  margin: -1px;
  (...)
```

where it should be:

```
.jui-cwmobilemenu .ui-helper-hidden {
  display: none;
}
.jui-cwmobilemenu .ui-helper-hidden-accessible {
  border: 0;
  clip: rect(0 0 0 0);
  height: 1px;
  margin: -1px;
  (...)
```

The strange thing is that the file "jquery-ui.theme.css" does have the ".jui-cwmobilemenu" prefixes. But this file is not needed in your system.

So, if a user wants to make new themes that should be used together on the same webpage, then the generated css files made by ThemeRoller do need some editing. With NetBeans this is no problem of course. So the help files need adjustment on this point. But it would be better if importing new themes could be possible without editing the files ThemeRoller generates.

Regards

It seems this is a problem with jQuery UI themes generator. Before it added "CSS scope" for all CSS rules.
