
How to Find a CSV file

Posted by SteMaturin - 2015/09/22 19:31

I loaded a csv data file onto my Joomla site backend, but I can't figure out how to get the Data Table module to recognize the file.

I'm totally new to this world, so be kind...

Hello,

Open "ARI Smart Content - Data Table" module settings page. Click by "Select" button for "Data Source" parameter. Select "CSV files - CSV files" value in "Select source provider" drop-down in the appeared popup. After this click by "New source" button. Enter path to CSV file in "CSV File" parameter and click "Save & Close" button. Select the created data source (click by source's name) in source data grid. That's all.

Regards,
ARI Soft

Tried that, but all I get is a "no data available" response on the front end. How can I make sure that the module is pointing to the correct file?

File path is case-sensitive. For example if you want to show data from Report.csv file which is stored in /images/data folder then populate "CSV File" parameter with images/data/Report.csv value.

If it doesn't help, could you specify where you save the file and what value is used in "CSV File" parameter?

Got it!

Cheers!
