
How to display Joint tables in a module or article

Posted by abuahassan - 2016/07/10 12:09

Hi,

I have set up my relational database consisting of 4 tables and I have come up with problems of where to go next. I can show individual tables in modules and articles but don't know how to show the relevant data when the tables are joint. I actually want to give an option to the user to check his status/ his relevant data such as his exam marks etc, that are recorded on the relational tables.

Can you help, i am not a coder but just a guy using extensions such as yours to configure joomla for a specific user group.

Kind regards

=====

Hello,

It is possible to use JOIN construction in "SELECT" SQL query to combine data from several tables. For example the following SQL query get data from #__content and #__categories tables:

```
SELECT
C.id AS ArticleId,
C.title AS Article,
CAT.title AS Category
FROM
#__content C INNER JOIN #__categories CAT
ON C.catid = CAT.id
```

Regards,
ARI Soft
