Numbering Rows

Posted by SteMaturin - 2016/08/29 20:49

_____

I have a data table that uses a query to return data from the database. I want to be able to number the rows returned, to give them a ranking.

Here is the query:

SELECT Score, Name, Position, CurrentAge
From database.table
Where Team = "A"

The scores are ordered correctly, but the results look like:

25, John, C, 18
36, Joe, LF, 19
etc

I'd like to show as

1, 25, John, C, 18
2, 36, Joe, LF, 19
etc.

Any advice would be greatly appreciated.

_____

Hello,

It is possible to use this solution.

Regards,
ARI Soft

_____

The code results in an error 15:

"unknown expr_type in expression subtree user_variable"

Any other advice?

_____

What query do you use?

_____

I've tried several of those examples. Anything with user-defined variables throws that same error.

_____

Update "ARI Smart Content" to v. 2.2.30 and try again. It should help.

Regards,
ARI Soft

_____

Is that a free upgrade, or do I have to purchase a new version. I can't find an upgrade on the site.

_____

Ah-Ha!

Perfect. Thanks for all of your help, as always.
