
server side paging changes child column display

Posted by robertbrandes - 2016/09/14 17:35

I am using the child column feature of the smart content data table, on a fairly large table. I would like to also use server side paging with that table. However, when I turn on server side paging, the data in the child column fields move from being in line with the column name to below the column name, causing the child columns display to be much longer and not have as appealing an appearance.

Hello,

Could you provide a link to a page where the problem occurs?

Regards,
ARI Soft

Link with server side paging off

http://www.elginroots.com/index.php?option=com_content&view=article&id=96&Itemid=506

link with server side paging on

http://wmb.elginroots.com/index.php?option=com_content&view=article&id=97&Itemid=503

To see the results best, use the second line of the table

Download and upgrade the extension to v. 2.2.31 and clean browser's cache. It should help to resolve the problem.
