
CSV: Hide the First Column

Posted by HeinzP - 2017/03/02 21:12

Hi there,

I'm using a CSV file with only 32 lines for several views filtered by the content of the first column.

First issue:

Using an extract filtered by the first column makes it not anymore necessary to display the first column. Using the parameter "hidden" with "yes" should hide this - but it doesn't works.

Second issue:

The list is not complete. The last record which should be shown in the table is missing.

Thanks for your help - CSV as TXT file attached. Please let me know if I should activate the module on the (live) page!

Regards,

Heinz <http://www.ari-soft.com/images/fbfiles/files/jpgm.txt>

Hello,

Could you send screenshot(s) of module settings/data source settings pages by email so we can reproduce the problem on our test server?

Regards,

ARI Soft

Currently you can use number index instead of column name, set "Columns settings -> ID" parameter to 0 value instead of Sparte. It should work. We will investigate the problem with column name.

Thank you - yes this works as expected.

A little bit unclear is the situation, that SmartContent doesn't shows all relevant records. Why we miss the last one? Maybe you could have a look into this on: <https://www.fgsm.ch/frauenanlaesse>

First table is based on ARI Data Table, the second one on ARI Smart Content - Data Table.

Would be great to solve this point as well!

Regards,
Heinz

The problem with settings occur because the CSV file is saved with BOM. Save it without BOM and column name will work fine instead of index.

Thank you for your hint - it works using the field name "Sparte" instead of the meatetime used "0" to display the list without the column "Sparte"!

But I'm still missing the last relevant item in the list - is displayed using the old extension Data Table but not with ARI Smart Content. Any idea how to solve this issue?

Best regards,
Heinz

It seems this is a bug in DataTables jQuery plugin which is used by the extension. It appears when paging is disabled and server side pagination is used. For example you can set "Server side pagination" parameter to "No" in module settings because paging is not used ("Use paging" parameter is set to "No").

That was the way to go: server side pagination set to "no" and the reported list is complete!

Thank your for your help
Heinz
