## Issue when upgrading to PHP 7

Posted by iatcb - 2017/05/02 20:59

---

I have Ari Smart Content 2.2.25 and Joomla 3.7.0. My ISP tried to upgrade to PHP 7 for me and he reported the following errors:

Deprecated: Methods with the same name as their class will not be constructors in a future version of PHP; plgSystemAriSmartContent has a deprecated constructor in /u3/sidprice/public\_html/iatcb.org/plugins/system/arismartcontent/arismartcontent.php on line 15

Deprecated: Methods with the same name as their class will not be constructors in a future version of PHP; plgSystemAriSmartContentloadmodule has a deprecated constructor in /u3/sidprice/public\_html/iatcb.org/plugins/system/arismartcontentloadmodule/arismartcontentloadmodule.php on line 15

They have downgraded the PHP installation. How can we resolve the above issues and upgrade to PHP 7?

Thanks,  
Sid

Hello,

Download the latest version of the extension (2.2.37) in "Member Area" on our site and upgrade it on your site.

Regards,  
ARI Soft

Thank you, that resolved my issue.

I would have expected Joomla to see an update was available, but it did not. Is there something I need to do to my installation to have this happen,  
Sid

Well it looks like the update did not resolve all the issues. I see the following error when I go to my Joomla site admin area:

Deprecated: Methods with the same name as their class will not be constructors in a future version of PHP; plgSystemAriSmartContentloadmodule has a deprecated constructor in /u3/sidprice/public\_html/iatcb.org/plugins/system/arismartcontentloadmodule/arismartcontentloadmodule.php on line 15

Download and update the extension again.

PS: Currently the extension doesn't support Joomla! updates. It will be implemented in a future version.

Thanks, once again it looks like it is working after the download and installation.

Hello

I have just upgrade arismartcontent version 2.2.39  
Joomla 3.7.5  
Php 7.0.10

My error is:

Deprecated: Methods with the same name as their class will not be constructors in a future version of PHP; plgSystemAriSmartContentloadmodule has a deprecated constructor in R:\Sites\_Internet\Sites\ambiances-musicales\plugins\system\arismartcontentloadmodule\arismartcontentloadmodule.php on line 15

Is this a fatal error ? (ari smartcontent does not work correctly) or only a warning message ?

there are today many extensions that are now compatible with PHP 7.0 (and some with 7.1...). What happens with ARI? Do you have an approximate date of release of a version compatible with PHP 7.0? with PHP 7.1? with PHP 7.2?

Thanks a lot.

Hello,

The extension is compatible with PHP 7.x, it seems an old version of "System - ARI Smart Content - Load Module" plugin is installed on your site. Run "ARI Smart Content" installation process again and on final page mark checkbox to update "System - ARI Smart Content - Load Module" plugin. It should help.

Hello

This is the solution.  
Thanks a lot.  
Jean-Marie
