
Data Table module ***Resolved***

Posted by Mobilepro - 2019/03/27 03:55

I've been using the standard ARI Data Table module and it has been working perfectly except that it is not responsive. I just purchased the Smart Content version thinking I could just copy over the db query in the data source and use all the same settings and I would have a responsive table.

While it mostly worked, when I use the exact same default filter search string it displays "No data found" and I'm at a loss why that is happening.

I would appreciate any help.

Thanks

Resolved

Did some template css overrides to make the original DT module responsive.
