## smart content (tabview) how does it work

Posted by courtney - 2010/11/05 17:07

---

I have seen the explanation in the samples on the site for how to use the "smart content". But it does not explain properly. The information only says add this code in the article. It does not explain where and how.

For example if I have 3 article. Article 1, article 2 and article 3 and I want each to show when I click the corresponding tab. Where do I place the code? Should I place it in each article? If I use the HTML view where in the article do I place the code. Can someone provide a complete example from start to finish?

Good call.. I've just bought the smart content for the JZoom function... and have found little on the details to make it work.

To courtney, we have sent link to video tutorial how to setup "ARI JTabView".

To ncds, do you have any problem or question now?

Regards,  
ARI Soft
