CSS styles for J1.6

_____

I installed ARI YUI menu and trying to customize. I saw the CSS style box saying "...You can use predefined variable {$id} which will be replaced with id of menu container". Can you please let me know which id I have to use? The module is placed in a div container with id "header" If possible one example please. Thanks in advance.

Re:CSS styles for J1.6

_____

Hello,

{$id} predefined variable will be replaced with value of "id" parameter of menu container HTML element. For example if you want to create red border around menu, enter the following code in "CSS Styles" parameter:

DIV#{$id}
{
 border: 2px solid red;
}

Regards,
ARI soft
