Submenu class handle

Posted by scott - 2011/03/09 05:24

_____

ARI YUI Menu is an excellent module. I've managed to modify the css to largely match the defunct menu system that I am replacing. At the top level of the menu the selected menu item has the class handle of yuimenuitem-selected which I can use to style the selected item.

Unfortunately, the submenu level does not appear to have a class handle in the html menu structure to which I can apply styling. I would also like to see an ancestor and parent class handle for the upper level menu item of the selected submenu item. I hope this makes sense to you. Is this possible to implement?

Thanks for a great module.
Scott

Hello,

Sorry, the module doesn't support this CSS class.

Regards,
ARI Soft

Thanks for your response. I don't know what you development cycle is like. Is this some that could be added to the next version release or should I fork it and add it myself?

Cheer,
Scott
