
Ari Yui Menu CSS

Posted by hpesce - 2011/04/21 10:36

Hi... I've found your menu and its very usefull... I have a question... I'd like to use your menu, but keeping the original CSS of my site... I'm actually using the JA PURYTI II template... The link to the site: <http://www.studiolegalepapa.it/test>

The original menu is the one on the left top... Your ARI YUI menu is the one on the bottom left... I'd like to use the same CSS that I'm using on the original menu with your menu.. how can I do?

Thanks and regards

Hello,

Information about menu styles can be found here. It should be useful for creating custom styles.

Thanks for the answer.... but there is any way to just connect the module with the original CSS?

No, each menu module uses own HTML layout and it requires to create custom CSS rules that change menu styles.

This error appears...

"Request denied.

Please verify that the file or folder exists and that you have the necessary permissions on the server to perform the requested operation."

I've trying to set it up with 755 or 777, but it doesn't allow me to do this...

The module doesn't change any file permissions. It can be a problem with web server configuration. Contact your hosting provide support that they fix the problem.
