
Ari yui vs. Ari Ext menu: scripts

Posted by Henner - 2011/06/02 17:15

Hi, very good work!

I use ARI EXT menu. Using jch_optimize I need to exclude ext-core.js, menu.min.js and the rather heavy mootools.js, which I did not need at all before.

I'd like to know if I could make all a bit lighter with the YUI menu. Therefore: would the scripts used in YUI reduce the load? (I saw on you demo page that mootools.js and other js scripts are on, but only menu-min.js is loaded specifically for the YUI menu).

Thank you and best regards,

=====

Hello,

The module loads only necessary javascript and CSS files, mootools.js is loaded by Joomla!

Correct, but without mootools, ARI EXT menu does not function. Would ARI YUI work without mootools?
Thanks

"ARI Ext Menu" doesn't require MooTools javascript library. It uses ExtJs library. If something doesn't work without MooTools, it can be a problem with 3rd party extension. We can investigate the problem if you provide link to page where we can see the problem.

PS: BTW, you can check browser's error console, we suppose it contains some errors.

That becomes interesting (at least for me as a newbie). Here is the site <http://apvl.org/>. I can disable mootols for a short while, just let me know when.

If you open HTML source of provided page, you can find the next code:

```
window.addEvent("domready", function() {  
    var JTooltips = new Tips($(".hasTip"), { maxTitleChars: 50, fixed: false});  
});
```

This code is required MooTools library and it is loaded by Joomla!. We suppose when you disable MooTools library, this code is not removed and causes javascript error and stops executing of script for menu module.

I found it, the culprit was the Qivva Eventlist Calendar module, used to display the events from the eventlist component. Disabled, there is no need of mootools anymore to have Ari Ext menu working.
Thanks a lot, your hint saved me lots of time - great work and help!
(you might want to copy this thread to the Ari Ext menu forum)
