
I can't work it out

Posted by kdx125 - 2012/05/11 15:14

Good morning, this is my 1st post.
I've found the "ARI YUI Menu" surfing in the net, and I think it's marvellous.
I was able to include it into my 1st site but I don't know why it doesn't work in the 2nd site I am still preparing. The parameters are exactly the same!
Can someone please help me?
Thank you

Andrea

Hello,

500 HTTP error occurs when the module tried to load CSS file. Contact your hosting support so they investigate this problem. It can be a problem with file permissions or server configuration.

Regards,
ARI Soft

What a quick answer!
Thank you very much, I will investigate with them.

Andrea
