
replace ux-menu suffix

Posted by ninJes - 2011/03/09 12:30

Hello.

In css styles parameter described option to replace menu suffix with some custom id.

I wrote there { \$id="topmenu" }

But it doesn't work. I am not strong at programming. Would you explain what exactly, what I should write in there to replace ul-menu with something else? How it works?

Hello,

For example if you want to change background of menu items, you can use the following code in "CSS Styles" parameter:

```
UL#{$id} LI A
{
  background: none red;
}
```

I want to change font color to white on top menu on this page.

<http://bole.mpm.org.il/arimenu>

I am using this code.

```
UL#{$id} LI A
{
  color: #FFF;
}
```

with no effect :(

Try the following:

```
UL#{$id} LI A
{
  color: #FFF !important;
}
```

It works but only with !important tag.

But this tag changes font color on submenu.

How can I apply one font color for menu and another to submenu.

I have two menus on same page. And for changing menu fontcolor I have to use !important tag. But my submenu and menu font color are different. And I can't use !important tag twice..

Use the following code:

```
UL#{$id} LI A
{
  color: #FFF !important;
}

UL#{$id} LI UL.ux-menu-sub A
{
  color: #FF0000 !important;
}
```
