
Ari Ext Menu and SobiPro

Posted by ajack036 - 2013/06/26 17:38

Hello,

I am using Sobipro as a business directory, see <http://www.yorkcountychamberva.org/index.php?Itemid=556>

The submenu on left is causing a gap in the top menu of sobipro. I solved the problem by editing the css of my template. making that div = col1_left posiiton absolute but this throws off my template design. I want to keep the column float:left. Is there some CSS for Ari Ext Menu that will allow the menu to not effect the SobiPro topmenu in right column.

Thanks.

Hello,

Send an image where we can see the problem and what do you want to achieve.

The screenshot current.png show the current state of Ari Ext Menu with all the menu items i need to show. The arrow points to the gap.

The screenshot correct.png shows the Ari Ext Menu with menu items disabled and the arrow depicts how the Sobipro Top menu should look.

<http://www.ari-soft.com/images/fbfiles/images/current.png>

How can I keep Ari Ext Menu from effecting the topmenu in sobipro.

Thanks!

You can modify Sobi template and load "ARI Ext Menu" module into necessary content using 3rd party extension like "Module Plant" or "Modules Anywhere".
