
Change menu from expand on rollover to click

Posted by dcara - 2013/08/21 20:24

Is it possible to use CSS to make the menu expand when clicked rather than on mouse over? I ask as I am trying to make my menu functional with mobile touch devices as well as standard PC's. The way the menu currently works when you click on a parent menu item on a touch screen device it opens the page associated with that rather than first displaying the sub sections. If this can not be done through css is there a way to make the parent menu items not launch any other page so when they are clicked on a touch device it would simply display the sub menu?

Here is a link to the site I am having trouble with.

<http://mydemo.cloudaccess.net>

Thanks,

Dave

Hello,

The menu works fine for us on mobile devices. When click by a parent menu item, sub-menus appears. If use double-click, parent menu will be opened.

PS: We can recommend to set "Load method" parameter to "DOM Ready" in module settings.

Regards,

ARI Soft
