
Drop down doesn't work on mobile.

Posted by careswho - 2013/11/01 21:22

Hi, I have used Ari Ext Menu and it works very well on laptops.

But on mobile, once we enter a menu with sub-menus none of the other menu items with sub-menus work. Items without any subs are clickable.

This happens only when we go into a menu-item with subs, that's when the rest become disabled.

Is there any solution to that? You can check the site at highcontrastconsulting.co.uk

Thanks..

Hello,

We have checked it on Android device in Chrome browser and the menu works fine.

Thanks for the reply.

Previously it wasn't. I didn't change nothing and the menu was aligned center. But on mobile and in IE it is aligned left. (It is still aligned center in Firefox and Chrome though).

Is there something that is wrong in my css?

H I tried again, it doesn't work still.

You can try this: Go to the services and then try to go to reports.

You can't! That's what my issue is.

Thanks,

Add the following CSS rule:

```
UL.ux-menu
{
display: inline-block !important;
```

}
