Sub Menu Hidden in IE 6 Behind DJ Image Slider

Posted by brucerick - 2010/08/10 20:51

_____

I've looked at similar problems and it usually means that you have to place overflow to visible for the module causing the problem, but I have had no luck at all with DJ Image Slider and IE 6. All other versions of every browser works but this one for me.

My test site is www.interactivetrainingsystems.com/its/. I'm sure this is an easy one but I've had no luck so far so any help would be appreciated.

Any suggestions yet? I've been playing with this for a few days now and just can't seem to get it to work on IE 6 to save my life. I've been changing overflow settings and z-indexing.

I finally got it. I had to set the z-index of .ux-menu li to a very large number. It seems that dj image slider must have a z-index set in the code that is very high since I couldn't find it in the css. I actually set z-indexing up to 100000 to get it to work properly in IE 6, although it worked fine in all of the other browsers before I made this change. Damn IE and it's strange behaviors.
