
Custom CSS styles to the menu

Posted by deon_jonker - 2010/10/20 11:00

Hi,

I am working on a Joomla site. I've added your menu module (ARI-Ext-Menu). I'm writing a custom template for the site.

My Question is: how can I write custom CSS rules for the classes and ID's of the module and how can I find out what the module calls the classes and Id's.

Say for example I want to set the width of the sub-menu with my custom written template. How do I go about accomplishing that?

Another question, sort of related to my first question; How do I display the sub-menu entries directly beneath each other. Like on the demo site.

I'll add a couple of screenshots of your demo menu and of my menu.

<http://www.ari-soft.com/images/fbfiles/images/mine.png> Your menu

Hello,

You can investigate module HTML structure with styles and CSS classed with help Firebug extension for FireFox browser.

Regards,
ARI Soft
